

EVALUATION

Web Design - Zabututi

ALEX AMON
GOVERNMENT OF ZABUTUTI

Design

Our webpage for the Zabututi Taxation Office (ZTO) was based off Alex's webpage mock-up as it was simple and Mykal's webpage mock-up wasn't much for its looks. Alex's mock-up is clean and simple and allows for effective navigation and use. The flag at the top right was replaced by 'ZTO' and a banner of flags was added to the top as well as a slightly different colour scheme for the overall webpage.

Calculation

The tax calculation algorithm that was chosen was Mykal's as his was more efficient in the calculation. This is because it starts asking about the income amount from a from the middle bracket number as opposed to Alex's where it starts right from the first income bracket to be taxed. This was important due to the graph using the algorithm many consecutive times in the shortest amount of time possible. The graph used to algorithm to plot out how much tax would be generated off how much income.

Reuse

The navigation bar from Mykal's previous assignment and Alex's footer also from his previous assignment has been reused for this webpage. This was to reduce the overall amount of time spent on coding previously coded features.
